RFID location systems provider, Access International Inc., has introduced a wireless tracking-and-sensing technology called The Enterprise Dot. Based on system-on-a-chip design, the technology is intended to offer a low-cost and small multifunctional wireless device that will provide visibility data about assets in the enterprise.

For example, the first product using the technology will be a software definable, battery-powered "Dot-OEM module" for product manufacturers. This device is small enough to be embedded into a variety of objects such as computers, test equipment, medical equipment, credential cards, pallets, and cartons.
